- I pannelli per le malattie mendeliane

Test sequenziali vs. Down

- Il primo test deve essere molto sensibile
- Il secondo test deve essere molto specifico

- Il test combinato è meno specifico e meno sensibile del DNA fetale
- La sensibilità del test combinato è tarata su 5% circa di FPR (1:300)
- Per rendere il test combinato più sensibile il cut-off va spostato a livelli simili o superiori a quelli della incidenza generale (1:700)

[a]Unaffected with any of trisomy 21, 18, or 13.

Test sequenziale : una ipotesi di riflessione

- La DR del test combinato può essere portata al 95% con un tasso di FP del 25-30% e pari ad un cut-off di 1:3500 circa

- **In tal modo reclutando il 25-30% di tutta la popolazione a cui offrire il DNA fetale avremmo una DR del 95% ed un tasso di FR di 1:1500 circa**
-
- Il test sequenziale riduce di circa il 75% le AC inutili ma perde il 5% dei feti affetti

- **Il fallimento del test contribuisce a diagnosticare circa il 2% dei casi di Down**

Items for today

Is nuchal translucency measurement useful when cell-free DNA testing is performed?

- *Lichtenbelt*: When NIPT for trisomies 13, 18, and 21 is offered to all women, NT measurement by itself has a limited added clinical value for the detection of fetal chromosomal anomalies.

- *O'Brien*: A positive NT ultrasound scan did not add to the cases of aneuploidy that were detected by cfDNA screening.

- *Langlois*: For women with a negative cfDNA screening result, NT measurement has limited clinical utility.

NT vs. cff-DNA vs. CVS

- NT non aggiunge nulla allo screening base col DNA fetale
  - Pur avendo scarsa specificità (50% circa) una NT aumentata (>95-99 centile) può essere utile ad identificare patologie rare cromosomiche, subcromosomiche e mendeliane

FINAL REPORT

Performance Characteristics

Region (associated syndrome)	Size Range (Mb)*	Median Size (Mb)*	Reportable Fetal Fraction	Estimated Sensitivity**	Estimated Specificity
Genome-wide	NA	NA	≥ 4%	96% (61–> 99%)	> 99.9%
22q11.2 (DiGeorge)	0.8–3.6	2.6	≥ 4%	> 74% (17–94%)	> 99.9%
15q11.2 (Prader-Willi & Angelman)	1.2–15.8	5.1	≥ 4%	> 59% (16–74%)	> 99.9%
11q23 (Jacobsen)	1.3–15.7	9	≥ 4%	> 87% (57–> 99%)	> 99.9%
8q24.11-q24.13 (Langer-Giedion)	7.6–8.8	7.9	≥ 4%	> 97% (80–> 99%)	> 99.9%
5p15.3 (Cri du Chat)	1.5–17.8	6	≥ 4%	> 83% (48–96%)	> 99.9%
4p16.3 (Wolf-Hirschhorn)	1.1–17.3	4.2	≥ 4%	> 73% (37–91%)	> 99.9%
1p36 (1p36 deletion syndrome)	1.6–13.3	3.8	≥ 4%	> 51% (13–81%)	> 99.9%

** Sensitivity estimated across the observed size distribution of each syndrome [per ISCA database nstd37] and across the range of fetal fractions
observed in routine clinical NIPT. Figures in parentheses indicate upper and lower estimates for sensitivity at the lowest reportable fetal fraction (4%)
and at fetal fraction ≥20%, respectively. Actual sensitivity can also be influenced by other factors such as the size of the event, total sequence counts,
amplification bias, or sequence bias.

Screening for 22q11.2 deletion syndrome by two non-invasive prenatal testing methodologies: A case with discordant results

Liang-Ming Lo [a, b], Chii-Shinn Shiau [a, b], Kuang-Chao Chen [a, b], S.W.S. Shaw [a, b, c, *], Peter Benn [d]

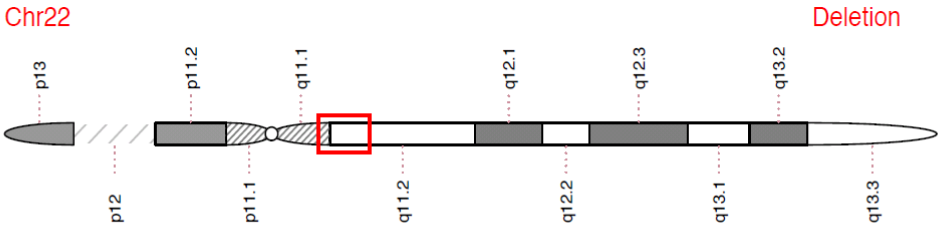
[a] *Department of Obstetrics and Gynecology, Taipei Chang Gung Memorial Hospital, Taipei, Taiwan*
[b] *College of Medicine, Chang Gung University, Taoyuan, Taiwan*
[c] *Prenatal Cell and Gene Therapy Group, Institute for Women's Health, University College London, London, UK*
[d] *Genetics and Genome Sciences, UCONN Health, 263 Farmington Avenue, E3050, Farmington, CT, USA*

Conclusion: Currently available NIPT for 22q11.2DS use different technologies that are not equivalent. The genome-wide counting methodology has the potential to detect deletions outside the critical 22q11.2 A–D region but current data suggests it may have a lower sensitivity for deletions within the critical region.

Test Result	Positive Loss of chromosome 22(q11.2) material

Laboratory Director's Comments
A loss of chromosome 22 material was observed. It is estimated to be 2.6 Mb in size and is suggestive of a deletion in the region 22q11.2, which is associated with DiGeorge syndrome. Genetic counseling and clinical correlation are recommended. Confirmatory testing is required if fetal confirmation and clinical interpretation of the suspected event are desired. Please refer to the "Performance" and "Limitations of the Test" sections of this laboratory report for additional information.

SEQUENOM®



Description: An approximate 2.6 Mb loss of chromosome 22 material was observed, suggestive of a deletion in the region q11.2, associated with DiGeorge syndrome.

natera

CONCLUSIONE

ALTO RISCHIO per delezione 22q11.2 (Sindrome di DiGeorge)
Si consiglia consulenza genetica. Si segnala che l'esame svolto è un test di screening, pertanto per una diagnosi definitiva è necessario eseguire test diagnostici con metodica microarray su villi coriali o liquido amniotico.

ESITO DEL TEST

Sesso del feto: Femmina

Frazione fetale: 7,2 %

Microdelezione testata [1]	Rischio a priori [2,4]	Rischio Panorama [3]	Risultato
22q11.2 (DiGeorge)	**1/2000**	**1/19**	**Alto rischio**
1p36	1/5000	1/12400	Basso rischio
Angelman	1/12000	1/16600	Basso rischio
Cri-du-chat	1/20000	1/57100	Basso rischio
Prader-Willi	1/10000	1/13800	Basso rischio

harmony® PRENATAL TEST

Toma Il tuo futuro, oggi | Istituto di Genetica Umana dal 1979

Screening della microdelezione 22q11.2 col test Harmony

Delezione 22q11.2

	Sensibilità	Rischio di falso positivo
Interne alla regione tipica da 3Mb*	75%[3-4]	0.5%[3-4]

*Include anche le piccole microdelezioni atipiche localizzate internamente alla regione tipica da 3Mb

TEST NEGATIVO: il test non rileva una riduzione dei frammenti circolanti di questa regione. E' comunque utile ricordare che il test indaga il 95% delle microdelezioni che causano la sindrome 22q11 e pertanto rimane un rischio residuo, seppur estremamente ridotto, che il feto possa comunque avere la sindrome. Non è raccomandato modificare il percorso di sorveglianza ecografica e clinica di routine.

DiGeorge II (10p14) Probe

Probe Information

DiGeorge syndrome[1], and a variety of congenital malformation syndromes including Velocardiofacial syndrome (VCFS)[2], share the deletion of chromosome 22 at 22q11.2[2,3,4,5]. These chromosome 22 deletions are collectively coined CATCH22, a mnemonic that covers the clinical findings of Cardiac abnormality, Abnormal facies, Thymic aplasia, Cleft palate and Hypocalaemia/Hyperthyroidism due to a chromosome 22 deletion. In DiGeorge syndrome, however, cases have also been found in which patients have a deletion on chromosome 10p13.4 (DGS2) instead of chromosome 22[6, 7,8]. The deletion of the DGS2 locus on 10p may be 50 times less frequent than that of the DGS1 locus on 22q and has been estimated to occur in 1 in 200,000 live births[9]. A gene called BRUNOL3 (now named CELF2) has been identified within the 300kb minimally deleted region of DGS2 and is postulated to be involved in the DGS2 deletion[10]. BRUNOL3 is a candidate gene for the heart defect and thymus hypoplasia/aplasia associated with partial monosomy 10p[10] and may be involved in atrial septal defects (ASDs), a common cardiac anomaly associated with DGS2[11].

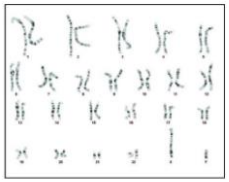
>7Mb Resolution

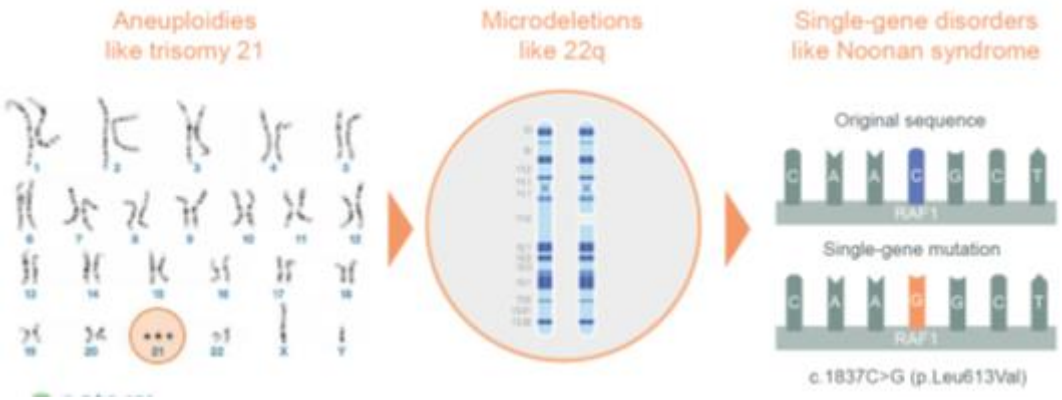
Can detect whole chromosome aneuploidy, large deletions and duplications



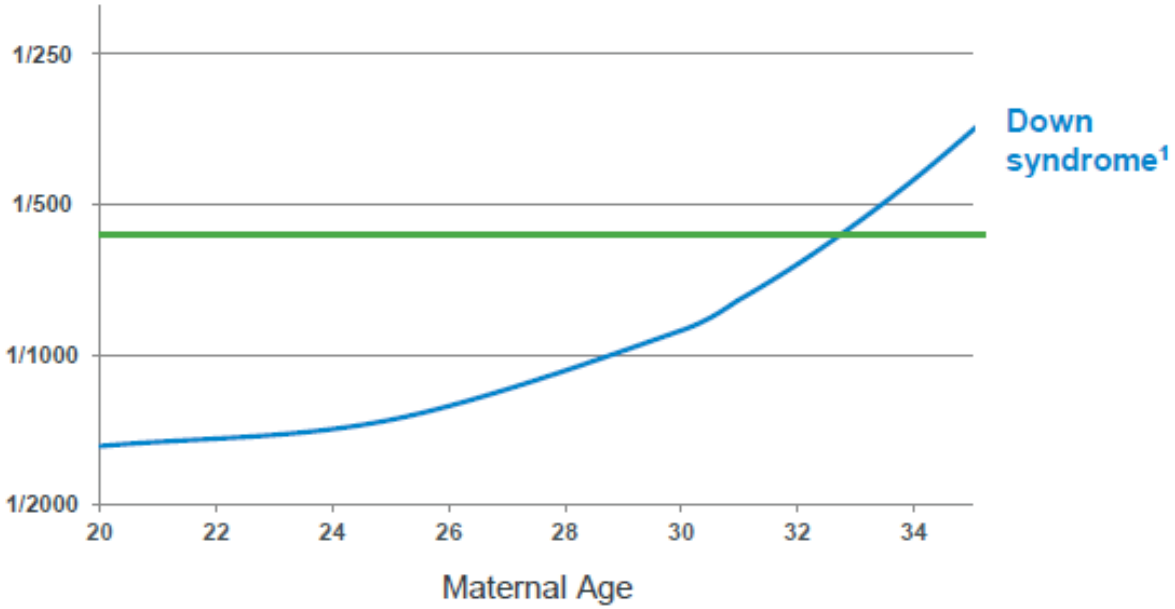
Microarray

>1Mb genome resolution, even smaller for critical regions

Can detect microdeletions and microduplications



Screening Malattie Mendeliane Dominanti de novo



Consider Vistara for the following indications:

Advanced paternal age

Women who want to know "more"

Ultrasound anomalies, such as shortened long bones and increased NT

Adjunct to CVS and amniocentesis

Compagnie che offrono Pannelli per le malattie mendeliane

Conditions screened

Syndromic Disorders	
Condition	**Gene**
Alagille Syndrome	JAG1
CHARGE syndrome	CHD7
Cornelia de Lange syndrome 1	NIPBL
Cornelia de Lange syndrome 2	SMC1A
Cornelia de Lange syndrome 3	SMC3
Cornelia de Lange syndrome 4	RAD21
Cornelia de Lange syndrome 5	HDAC8
Epileptic encephalopathy, early infantile, 2	CDKL5
Intellectual disability	SYNGAP1
Rett syndrome	MECP2
Sotos syndrome 1	NSD1
Tuberous sclerosis 1	TSC1
Tuberous sclerosis 2	TSC2

Craniosynostosis Syndromes	
Condition	**Gene**
Antley-Bixler syndrome without genital anomalies or disordered steroidogenesis	FGFR2
Apert syndrome	
Crouzon syndrome	
Jackson-Weiss syndrome	
Pfeiffer syndrome type 1/2/3	

Skeletal Disorders	
Condition	**Gene**
Achondroplasia	FGFR2
CATSHL syndrome	
Crouzon syndrome with acanthosis nigricans	
Hypochondroplasia	
Muenke syndrome	
Thanatophoric dysplasia, type I	
Thanatophoric dysplasia, type II	
Ehlers-Danlos syndrome, classic	COL1A1
Ehlers-Danlos syndrome, type VIIA	
Osteogenesis imperfecta, type I	
Osteogenesis imperfecta, type II	
Osteogenesis imperfecta, type III	
Osteogenesis imperfecta, type IV	
Ehlers-Danlos syndrome, cardiac valvular form	COL1A2
Ehlers-Danlos syndrome, type VIIB	
Osteogenesis imperfecta, type II	
Osteogenesis imperfecta, type III	
Osteogenesis imperfecta, type IV	

Noonan Spectrum Disorders	
Condition	**Gene**
Cardiofaciocutaneous syndrome 1	BRAF
Cardiofaciocutaneous syndrome 3	MAP2K1
Cardiofaciocutaneous syndrome 4	MAP2K2
Costello syndrome / Noonan syndrome	HRAS
Noonan syndrome 1 / LEOPARD syndrome/cancers	PTPN11
Noonan syndrome 4	SOS1
Noonan syndrome 5 / LEOPARD syndrome 2	RAF1
Noonan syndrome 6 / cancers	NRAS
Noonan syndrome 8	RIT1
Noonan syndrome 9	SOS2
Noonan syndrome/cancers	KRAS
Noonan syndrome-like disorder with loose anagen hair	SHOC2
Noonan syndrome-like disorder with or without juvenile myelomonocytic leukemia (NSLL)	CBL

vistara
POINT MUTATION NIPT

Disorder	Clinical actions
Osteogenesis imperfecta	• Labor and delivery management to avoid fractures • Neonatal care • Early recognition and treatment of fractures
Achondroplasia	• Labor and delivery management • Monitor for spinal stenosis • Early sleep studies to reduce probability of SIDS
Noonan syndrome	• Fetal echocardiogram • Labor and delivery management • Early assessment for learning differences
Craniosynostosis	• Fetal MRI • Avoid instrumented delivery • Corrective surgery • Early medical and behavioral interventions

GeneSafe™ DE NOVO identifies fetal conditions that could be **missed by traditional prenatal screening.**

GENE	SYNDROMIC DISORDERS
JAG1	Alagille syndrome
CHD7	CHARGE syndrome
HDAC8	Cornelia de Lange syndrome 5
NIPBL	Cornelia de Lange syndrome 1
MECP2	Rett syndrome
NSD1	Sotos syndrome 1
ASXL1	Bohring-Opitz syndrome
SETBP1	Schinzel-Giedion syndrome
SIX3	Holoprosencephaly
	NOONAN SYNDROMES
BRAF	Cardiofaciocutaneous syndrome 1
CBL	Noonan syndrome-like disorder with or without juvenile myelomonocytic leukemia (NSLL)
KRAS	Noonan syndrome/cancers
MAP2K1	Cardiofaciocutaneous syndrome 3
MAP2K2	Cardiofaciocutaneous syndrome 4
NRAS	Noonan syndrome 6/cancers
PTPN11	Noonan syndrome 1/ LEOPARD syndrome/cancers
PTPN11	Juvenile myelomonocytic leukemia (JMML)
RAF1	Noonan syndrome 5/LEOPARD syndrome 2
RIT1	Noonan syndrome 8
SHOC2	Noonan syndrome-like disorder with loose anagen hair
SOS1	Noonan syndrome 4

GENE	SKELETAL DISORDERS
COL2A1	Achondrogenesis, type II or hypochondrogenesis
FGFR3	Achondroplasia
	CATSHL syndrome
	Crouzon syndrome with acanthosis nigricans
	Hypochondroplasia
	Muenke syndrome
	Thanatophoric dysplasia, type I
	Thanatophoric dysplasia, type II
COL1A1	Ehlers-Danlos syndrome, classic
	Ehlers-Danlos syndrome, type VIIA
	Osteogenesis imperfecta, type I
	Osteogenesis imperfecta, type II
	Osteogenesis imperfecta, type III
	Osteogenesis imperfecta, type IV
COL1A2	Ehlers-Danlos syndrome, cardiac valvular form
	Ehlers-Danlos syndrome, type VIIB
	Osteogenesis imperfecta, type II
	Osteogenesis imperfecta, type III
	Osteogenesis imperfecta, type IV
	CRANIOSYNOSTOSIS SYNDROMES
FGFR2	Antley-Bixler syndrome without genital anomalies or disordered steroidogenesis
	Apert syndrome
	Crouzon syndrome
	Jackson-Weiss syndrome
	Pfeiffer syndrome type 1
	Pfeiffer syndrome type 2
	Pfeiffer syndrome type 3

GeneSafe™ detects de novo mutations in 25 genes causing 44 different genetic disorders. The genetic conditions screened by this innovative test often occur in the absence of a family history of the condition. This is a paradigm shift in prenatal screening. GeneSafe™ screens for de novo mutations that cannot be detected by standard carrier screening, as these mutations are not present on the parents. The genetic disorders screened by GeneSafe™ can cause **skeletal dysplasias, cardiac defects,** [1-2-3] **multiple congenital anomalies,** [4-5] **autism,** [6] **epilepsy** [7] **and/or intellectual disability.** [8-9]

Tuberous sclerosis 1	*TSC1*	AD
Tuberous sclerosis 2	*TSC2*	AD

Pannelli per le malattie Mendeliane recessive

GeneSafe™ INHERITED

allows detection of common inherited genetic disorders in the fetus

GENE	GENETIC DISORDER
CFTR	Cystic Fibrosis
CX26 (GJB2)	Deafness autosomal recessive type 1A
CX30 (GJB6)	Deafness autosomal recessive type 1B
HBB	Thalassemia-Beta
HBB	Sickle cell anemia

Malattie ad elevata incidenza rilevate con Vera Omnia®	GENE
Fibrosi Cistica	CFTR
Sordità ereditaria tipo 1A	CX26 (GJB2)
Sordità ereditaria tipo 1B	CX30 (GJB6)
Beta Talassemia	HBB
Anemia falciforme	HBB
Fenilchetonuria	PAH

Malattie a bassa incidenza e/o ad insorgenza *DE NOVO*	GENE
Malattie Sindromiche	GENE
Sindrome di Gaucher	GBA
Sindrome Dubowitz	LIG4-NSUN2
Sindrome di Richner-Hanhart	TAT
Sindrome di Sjögren-Larsson	ALDH3A2

VERAgene
comprehensive NIPT

Table 1. Summary of the 50 monogenic disorders targeted on VERAgene.

Condition	Gene	# of mutations targeted
Abetalipoproteinemia	*MTTP*	1
Arthrogryposis, mental retardation seizures	*SLC35A3*	1
Autosomal recessive polycystic kidney disease	*PKHD1*	30
Bardet Biedl syndrome 12	*BBS12*	4
Beta thalassemia	*HBB*	88
Canavan disease	*ASPA*	4
Choreacanthocytosis	*VPS13A*	1
Crigler Najjar syndrome, Type I	*UGT1A1*	10
Cystic fibrosis	*CFTR*	122
Factor V Leiden thrombophilia	*F5*	1
Factor XI deficiency	*F11*	4
Familial dysautonomia	*IKBKAP*	3
Familial Mediterranean fever	*MEFV*	8
Fanconi anemia (FANCG-related)	*FANCG*	3
Glycine encephalopathy (GLDC-related)	*GLDC*	2
Glycogen storage disease, Type 3	*AGL*	14
Glycogen storage disease, Type 7	*PFKM*	3
GRACILE syndrome	*BCS1L*	12
Inclusion body myopathy, type 2	*GNE*	2
Isovaleric acidemia	*IVD*	1
Joubert syndrome, type 2	*TMEM216*	2
Junctional epidermolysis bullosa, Herlitz type	*LAMC2*	1
Leber congenital amaurosis (LCA5-related)	*LCA5*	3
Leydig cell hypoplasia [Luteinizing hormone resistance]	*LHCGR*	10
Limb girdle muscular dystrophy, type 2E	*SGCB*	6
Lipoamide dehydrogenase deficiency [Maple syrup urine disease, type 3]	*DLD*	7
Lipoprotein lipase deficiency	*LPL*	1
Long chain 3-hydroxyacyl-CoA dehydrogenase deficiency	*HADHA*	2
Maple syrup urine disease, type 1B	*BCKDHB*	5

NIPD GENETICS

https://www.nipd.com/veragene/

Panelli avanzati mendeliani

- Mancanza di informazioni chiare sulle performance
- Mancanza di indicazioni cliniche specifiche
- Forse la prima proposta : Malattie recessive in genitori carrier e/o in aree geografiche a rischio aumentato
- Panelli per malattie dominanti de novo prima dell'ecografia del 2 trimestre
-

Conclusioni

- Quadro in rapida evoluzione
- Competenza di genetica clinica e molecolare
- Alta aspettativa delle pazienti (spesso inaccettabile la performance del test combinato)
- Offerta «privata» deve essere «provata» da pubblicazioni su casistiche prospettiche
- La diagnosi invasiva del futuro ha un nuovo ruolo molto più mirato e di alta competenza
